

Abstract of the Invention

A system and method for notifying users in a manner that is appropriate for the event and the environment for the user. The method of the present invention relates to determining the desired properties of an event and assigning varying notification characteristics to that event. Profiles are created of the various events, wherein each profile relates to a different mode or situational environment, such as a meeting environment, an office or normal environment, a louder outside-type environment, etc. The invention further relates to placing the small computer device in a particular mode, either automatically or manually. Once in a particular mode the device provides notifications according to that mode.
